ICT International Pty Ltd Testimonial

I first became aware of this small technology company based in Armidale when I needed specific robust soil monitoring equipment capable of being permanently buried in the capping layers of landfills. It transpired that the equipment being marketed by ICT International had been developed and manufactured by themselves to international standards. ICT also developed software which allows the data to be cost effectively transmitted via the cloud directly to clients computers.

The inclusion of this monitoring technology in our program has helped us obtain client approval to introduce an innovative landfill capping technology here in south-east Queensland.

Because of their broad experience across a number of industries (including the waste management and agricultural Industries), ICT have also provided us with expert technical advice on placement and maintenance of instruments as well as what new techniques they are developing to assist clients in this quickly changing market place.

With their world standard technical knowledge, their innovative approach to development and their excellent customer service, I consider ICT International Pty Ltd a "Business of Tomorrow".
