Dear Sir /Madam,

Tropical Forestry Services have been working with ICT International since 2012, developing research synergies to aid in the management of a valuable water resource in irrigating Indian Sandalwood plantations in the North of Australia. The outcomes of the subsequent collaboration with the world leading scientists at ICT International far exceeded all of our expectations, rapidly developing and deploying a bespoke remote irrigation monitoring system proven to be the most advanced and effective water management system in horticulture, forestry or agriculture worldwide. The value of ICT International lies in the ability to draw from the working knowledge of their extensive network in the international scientific community combined with their product development expertise to deliver unique, highly effective industrial solutions. The new generation plant-based water monitoring system they developed is now the global benchmark for water management in agricultural systems and ICT will likely maintain this position as international industry pioneers for decades to come. The team at ICT International are the perfect example of home-grown scientific innovation coalescing real examples of Australian leadership pursuant of global environmental stewardship and sustainability goals.

Sincerely,

A handwritten signature in blue ink, appearing to read 'D. Manson', with a long horizontal flourish extending to the right.

Dr. Daniel Manson
